

## 8. Weight of dry antlers

When determining the weight of the antlers, the short nosed cut skull is regarded as the standard cut, with a small nasal bone and the path of the line through the centre of the orbital cavity. For antlers with a full upper jaw, the weight is 0.70 kg and is reduced to 0.50kg without the row of teeth (fig. 2-G).

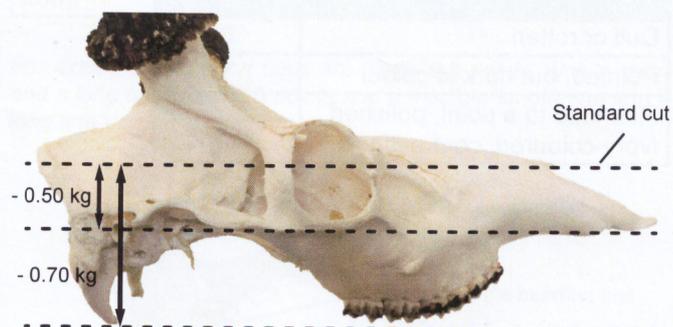

fig. 2-G: Weight deduction for entire skull with complete upper jaw is 0.70 kg or upper jaw with sanded down row of teeth is 0.50 kg.
